

1. List three real-life scenarios where a multimeter would be used to troubleshoot a computer or smartphone issue and explain in one line how the multimeter helps in each case.

1. Computer not turning on	A multimeter checks if the power supply is giving the correct voltage.
2. Smartphone not charging	A multimeter checks if the charger or battery is providing power.
3. Laptop battery problem	A multimeter measures the battery voltage to see if the battery is good or dead.

2. Watch a short YouTube video demo of a POST card in action (search for 'POST card motherboard test'), then write a brief summary (3-4 lines) describing what the POST card displays and what problem it helped identify in the video. Hint: Focus on the codes shown and how they relate to hardware issues.

In the video, the POST card displays two-digit hexadecimal POST codes while the motherboard performs its Power-On Self-Test (POST). Each code represents a different hardware test stage during system startup. The system stopped on a specific code, which indicated a hardware fault. By checking the displayed code against the BIOS POST code list, the faulty component could be identified and troubleshoot.

3.Download and install any free software diagnostic tool (such as HWMonitor, Speccy, or CrystalDiskInfo), run it on your laptop or desktop, and take a screenshot of the main dashboard showing system health details.Constraint: Blur or crop out any personal information before submitting.

4.Compare the use of a multimeter, POST card, and software diagnostics by creating a table with three columns (Tool, What it checks, Example Problem Detected) and fill in at least one example for each tool.

Tool	What it checks	Example Problem Detected
Multimeter	Checks voltage, current, and continuity	Power supply is not giving correct voltage
POST Card	Checks motherboard startup errors (POST codes)	Faulty RAM or motherboard problem
Software Diagnostics	Checks hardware and system performance	Hard disk errors or driver problems
